

PRESS RELEASE

Grenchen, 22.07.2022

Thommen Medical presents the new gingiva former narrow

Inflammation-free gingiva and sufficient soft tissue volume are central to the long-term success of an implant restoration. From now on, the new gingiva former narrow from Thommen Medical provides more flexibility in soft tissue management – for best possible outcomes. In combination with the conventional gingiva former, the new gingiva former narrow can be used to exert controlled compression on the soft tissue in a two-stage procedure.

The narrow shape is the optimal basis for esthetic and functional peri-implant soft tissue, as the tighter wound closure promotes effective wound healing. The narrow design reduces tension around the suture and minimizes free wound surfaces. Thereby, the risk of infection is limited while optimal blood circulation is supported.

The new gingiva former narrow from Thommen Medical – the solution for optimal soft tissue management.
